Priority

1. Acknowledgment is made of applicant's claim for foreign priority based on an application filed in Japan on October 8th 2002. It is noted, however, that applicant has not filed a certified copy of the Japanese application as required by 35 U.S.C. 119(b).

Claim Rejections - 35 USC § 103

2. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

> (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.

3. Claims 1-4 are rejected under 35 U.S.C. 103(a) as being unpatentable over Chung et al (US 6919513) in view of Atou (US 6633002).

Chung discloses a film carrier tape comprised of an insulating base film (200), a wiring pattern (254), a reinforcement film (243) and a plurality of sprocket holes (222).

The wiring patterns are formed onto the surface of the insulating base film (200) (col 4 L 13-17). The insulating base film (200) has a thickness of 25-50 μm (col 4 L 11-12). The reinforcement film (243) is attached to the lower surface of the insulating base film (200) and attached only onto the two peripheral areas of the insulating base film.

The sprocket holes (22) are formed along the peripherals of the insulating base film (200) and the reinforcement film (243) (col 4 L 3-7 & Fig. 4).

Chung teaches the structure of the present invention but does not teach that the reinforcement film is a stainless steel material, nor does it teach the wiring pattern has a pitch value.

Atou teaches a tape carrier comprised of a base film (1) and a wiring pattern (7). The wiring pattern (7) is formed over the surface of the base film (1) (col 3 L 29-30 & L 52-54). The wiring pattern has a pitch value of 60 μm (col 6 L 19-24).

In view of the prior art teachings, one skill in the art would fabricate a tape carrier with wiring patterns over a base film (1) and that the wiring pattern has a pitch value of 60 μm or less because this pitch is not unachievable and not uncommon.

Since applicant has not distinguished any advantages of using stainless steel foil for the reinforcement member, the examiner takes the position that such choice is just a matter of design choice.
